(Advantage and limitation of fine needle aspiration cytology of mediastinal lymph nodes) in order to enhance the diagnostic accuracy in the cytological diagnosis of the lymph nodes of the mediastinum, the region of the size and the number of the lymph nodes to the size of the needle has been studied. Cytological examination was performed in 634 lymph nodes with a 21 G needle. These lymph nodes were divided into 3 groups: under 1.0 cm in diameter, between 1.0 cm and 2.0 cm in diameter, and over 2.0 cm in diameter. There was no significant difference in the diagnostic accuracy among the above groups. Fourteen per cent of the lymph nodes were located in the intraaxillary region, 30 per cent were located in the paratracheal region, 20 per cent were in the posterior triangle region, and 34 per cent were in other regions. When the lymph node was located in the posterior triangle, the diagnostic accuracy was remarkably lower than other locations. Seven per cent of the cases showed reactive atypical lymphocytes, and in all but 1 case of Hodgkin's disease (8%), the atypia was found as reactive. The results indicate that there is no merit in widening the size of the needle for mediastinal lymph nodes of over 2.0 cm in diameter. Court's analysis of St. Louis' status as a market participant and its resolution of the per se and
